Company Background

JAJE Beans, established in 1926, began as a vehicle manufacturer known for reliability and durability. The company is named after its four founders. In 1978, the company's vehicles were officially adopted into Singapore's public transport ecosystem, a major step in its growth and reputation. Today, JAJE Beans has pivoted and rebranded itself as a sustainability-driven mobility company, focusing on electric vehicles (EVs) and low-emission transport solutions for both private consumers and public-sector fleets.

JAJE Beans is committed not only to producing EVs, but also to improving public understanding and confidence through customer education. By helping consumers make informed decisions, JAJE Beans supports Singapore's sustainability goals while strengthening trust in EV adoption and building long-term demand for cleaner vehicles.

JAJE - Intro

Roughly 6.3% of the total car population in Singapore consists of EVs. In JAJE Beans, the issue is consumers don't realise the benefits of using EVs compared to petrol vehicles, nor do they understand the environmental impacts of their choice of vehicle. Hence, users may be hesitant to purchase EVs. The introduction aims to educate users on the advantages of using EVs and the disadvantages of petrol vehicles.

From the 2023 Global Automotive Consumer Study by Deloitte, many consumers are reluctant to adopt EVs due to myths about their battery longevity, range anxiety, and high prices. These misconceptions drive consumers to rely on petrol vehicles, which leads to increased carbon emissions. Addressing these misconceptions will be essential to encourage the change from petrol to EVs.

The scratch will have interactive pages with factual comparisons focused on key areas between EVs and petrol, which will then later be tested in the quiz section. This will correct the misconceptions that consumers may have about EVs.

Through this approach, the introduction eases users into EVs by spreading awareness and helping users understand. JAJE Beans seek to motivate consumers to view EVs as a sustainable alternative to petrol vehicles.

Aarush - Quiz

In JAJS Beans, one issue JAJS is facing is that customers may not retain the information they learn about electric vehicles. The popular Ebbinghaus Forgetting curve shows that people can forget 50% of information they learn within an hour and up to 70% of information within a day. This may pose a challenge as key facts about EVs over petrol cars may be forgotten after the introduction.

To address this issue, a quiz will be implemented to strengthen understanding the key points introduced in the introduction. This quiz will encourage active recall, testing users to retrieve information rather than passively consuming it. This will strengthen memory and allow misconceptions about EVs to be identified and corrected immediately.

Through the reinforcement of learning through the quiz, users develop a more accurate understanding of EVs. This increases user confidence in EV adoption and provides more informed decision-making. In the long-term, this promotes sustainable transport choices but also benefits JAJS Beans by improving customer trust and engagement.

A wireframe diagram of a quiz interface. The background is a solid brown color. In the top-left corner, there is a circular logo containing a black three-leaf clover-like symbol, with the text "JAJS" in black below it. To the right of the logo, the title "Quiz - Wireframe (Aarush)" is written in black. In the center of the screen, there is a large, light-orange rectangular box with the word "QUESTION" in black, centered within it. Below this box, there are four smaller, light-orange rectangular boxes arranged in a 2x2 grid. The top-left box contains "OPTION 1", the top-right box contains "OPTION 2", the bottom-left box contains "OPTION 3", and the bottom-right box contains "OPTION 4". At the bottom-left of the screen, there is a small, light-orange rectangular button with the text "back" in black. At the bottom-right of the screen, there is a small, light-orange rectangular button with the text "next" in black.

Jun Kang - Game

In JAJS Beans, one problem JAJS is facing is that users are avoiding electrical vehicles. This is because there is an assumption of not enough charging locations and electrical vehicles are not reliable in long distance driving . However, a study by Statista Research Department on 29 July 2024 states, "Convenience remains a key factor, the availability of home or neighborhood charging plays a significant role in adoption." It has been strategically calculated and it has sufficient charging infrastructure to get around Singapore. To combat the issue of users thinking there are not enough charging locations, we are creating a scratch game to solve this problem. This scratch game is a highscore game where you dodge obstacles to reach the highest score. This will prompt the user that an electric vehicle can go for long distance driving without fuel issues. There is a carpark along the side where the electrical vehicle can refuel and get a speed boost. The speed boost is to make the game more engaging. After completing the game, users will notice that both electrical vehicles and petroleum vehicles have the same issues of insufficient fuel. Then the users will understand that most car parks have a charging infrastructure and more charging infrastructure are to come. Lastly, there are going to be consistent game updates to show that there is more charging infrastructure coming in real life to support more long distance driving.

Seth - Feedback

In JAJS Beans, one key issue JAJS is facing is the lack of certainty regarding the effectiveness of the game, introduction and quizzes. Without clear feedback, it becomes difficult to evaluate whether the components are successful in communicating the points to the users. This is a significant issue, as ineffective communication limits our ability to refine and improve the learning experience. A survey has shown that 92% agreed that customer experience is a vital factor in their purchase decisions.

To address this issue, the scratch component is a feedback form designed to help JAJS Beans determine whether our game, introduction and quizzes are effective in communicating the benefits of electric vehicles. This feedback system allows us to assess how well the users understand the information given and whether the intended message is effectively communicated. By collecting direct responses, JAJS Beans can identify the strengths and weaknesses in our learning experience.

The feedback collected will be used to improve our introduction, game mechanics, and quiz design. This approach ensures that the project remains responsive to users' needs. By continuously refining these components based on users' feedback, JAJS Beans can enhance customers' understanding of the benefits of EVs and improve overall user experience, and encourage them in adopting electric vehicles over petrol-powered vehicles.
